

Jeffco Public Schools in Denver, Colorado recently decided to transition their sixth-grade students into middle-school and needed to accommodate for the addition of 400 students. The existing building hosted traditional classrooms and learning areas, challenging the design team to seamlessly integrate the two buildings while incorporating collaborative learning elements into the addition.

Through working directly with the Design Advisory Group comprised of community members, students and teachers, the design team developed an innovative collaboration space complete with a learning stair and built-in booth, offering options for students to spread out and learn in whichever form fits them best.
