Three types and color variations of corrugated metal panels elevated the modular classroom building referring to the residential tile roofs of neighboring residential while the material reflects the industrial area. The storefront-style façade with tree-lined sidewalks also weaves the school seamlessly into the surrounding neighborhood.
Rollup doors integrated into the modular design allow for program flexibility, indoor outdoor learning, passive cooling and community engagement.
This modular building kit of parts allowed for parallel site development and construction reducing the schedule and labor cost.
Once site development was completed, the building components were delivered and assembled by crane. Construction was completed within that 6 months designated.
A safe, welcoming, and informal environment allows staff to meet with student family to engage family involvement in learning. The indoor-outdoor areas were designed with this purpose in mind allowing for casual meetings and community events.
